

[002 / INTAKE]

Document intake assistant

Manual review work becomes structured extraction, validation, exception handling, and traceable handoff.

CLIENT	SECTOR	DURATION	STACK
Anonymized review operation	Document-heavy operations	6 weeks	LLM extraction - Review queues - Audit log

[01] Problem

- Teams manually reviewed incoming documents, copied key details, and lost time checking inconsistent submissions.
- Different document formats made routine intake work difficult to standardize.
- Low-confidence cases were mixed with simple work, slowing down the whole review queue.

[02] Approach

- Separated document extraction, deterministic validation, human review, and final handoff.
- Treated AI output as a draft until confidence checks and reviewers confirmed it.
- Created exception queues so people handled risk and ambiguity instead of every document.

[03] Implementation

01 Document surface	02 Extraction path	03 Traceable handoff
Grouped incoming files by type, source, required fields, and review risk.	Separated AI drafting from validation and human approval queues.	Logged every decision so the system can be audited and improved over time.

[04] Results

MANUAL REVIEW LOAD	FIELD CAPTURE	HANDOFF TRACEABILITY
BEFORE100%	BEFOREManual	BEFOREPartial
AFTERException-only	AFTERDrafted	AFTERLogged

"The value was not just extraction. It was knowing exactly which cases needed a person."
