

[001 / OPERATIONS]

Operations command center

A fragmented status process becomes a shared operating view for leaders and delivery teams.

CLIENT	SECTOR	DURATION	STACK
Anonymized operations team	Delivery operations	8 weeks	React - Node - Workflow rules

[01] Problem

- Leaders depended on scattered updates, manual follow-ups, and late status visibility across active work.
- Delivery teams repeated the same status reporting in meetings, chats, and spreadsheets.
- Exceptions were hard to see until work was already late or blocked.

[02] Approach

- Mapped the operating rhythm and the decisions leaders needed to make each week.
- Defined role-based views for executives, delivery leads, and contributors.
- Designed workflow states so status updates happened inside the operating system.

[03] Implementation

01	Operating map	02	Visibility layer	03	Automation rules
	Defined work states, owners, blockers, and leadership reporting rhythm.		Designed role-based dashboards for active work, exceptions, overdue items, and handoffs.		Routed reminders and status changes so updates happen inside the operating flow.

[04] Results

STATUS PREP TIME		UPDATE LATENCY		FOLLOW-UPS PER WEEK	
BEFORE	6 h/wk	BEFORE	2 days	BEFORE	12/wk
AFTER	45 min/wk	AFTER	Same day	AFTER	2/wk

"This is the first time status became part of the operating rhythm instead of another meeting artifact."

NEXT STEP

Use this format to scope a practical automation or software roadmap.
